PROFESSIONAL SUMMARY

Backend .NET developer with around 3 years of commercial experience building ASP.NET Core APIs, working with SQL Server via Entity Framework Core, and shipping software through CI/CD pipelines. I've worked at both enterprise scale (Cognizant) and in a small product team (Zenco Legal), so I'm comfortable with the full cycle – design, build, review, deploy and maintain. I have hands-on experience with Docker multi-stage builds, JWT-based authentication, SignalR, and Git Flow, and I'm used to working closely with product and design to turn requirements into something that actually works well for end users.

EDUCATION

De Montfort University

MSc Software Engineering

Leicester, United Kingdom

Jan. 2023 – Sep. 2024

Gokaraju Rangaraju Institute of Engineering and Technology

Bachelor of Technology in Computer Science

Hyderabad, India

2017 – 2020

EXPERIENCE

Full Stack Developer – Commonwealth Bank

Forage

May 2026 – Present

Remote, UK

- Extended an ASP.NET Core backend using C# – added new API endpoints, updated data models, and wired up MongoDB to support new business requirements.
- Wrote xUnit tests for the new endpoints and used Postman to validate request/response behaviour before marking things done.
- Followed Git Flow throughout: feature branches off develop, sensible commit messages, PRs reviewed before merging – kept the history clean.
- Worked independently across design, implementation and testing which meant managing my own time and priorities without much hand-holding.

Full Stack Developer

Zenco Legal

Jan. 2025 – Apr. 2025

Leicester, United Kingdom

- Built and maintained ASP.NET Core REST APIs used by client-facing services – document workflows, payments and customer management. Entity Framework Core for all data access against SQL Server.
- Implemented JWT-based authentication and role-based access control; also handled some SSO integration work for a third-party service the platform relied on.
- Set up Docker multi-stage builds so the same image worked cleanly in both dev and production – saved a lot of “works on my machine” headaches.
- Small team, so I was involved in most things: sprint planning in Jira, Azure DevOps CI/CD pipelines, code reviews and production deployments.

Programming Analyst

Cognizant

Mar. 2022 – Jan. 2023

Hyderabad, India

- Built and maintained enterprise CMS platforms using C#, ASP.NET MVC and SQL Server – mostly backend API work with T-SQL queries and stored procedures on the data side.
- Designed reusable components and integrated third-party APIs; identified and fixed several performance bottlenecks in existing services that were slowing down client dashboards.
- Handled production support alongside feature delivery, which meant debugging live issues quickly and communicating clearly with the team about what was broken and why.
- Promoted to Analyst after a year – started taking ownership of tasks end-to-end and reviewing code from junior team members.

Programmer Analyst Trainee

Cognizant

Mar. 2021 – Feb. 2022

Hyderabad, India

- Got up to speed on .NET, C# and ASP.NET MVC quickly by working directly on live client projects alongside senior developers.
- Contributed to API integrations, component builds, bug fixes and deployments – started with paired tasks and gradually took on things independently.
- Learned the team's code review process and Git workflow from day one, which built good habits early around code quality and version control.

PROJECTS

CommBank .NET API Server | *ASP.NET Core, C#, MongoDB, REST APIs, xUnit, Git Flow*

- Extended an existing ASP.NET Core API – added endpoints, updated data models and wrote xUnit tests to cover the changes. Managed everything through Git Flow with proper branching and PRs. [GitHub](#)
- Good example of the backend work I'm most comfortable with: picking up an existing codebase, understanding it properly, then extending it without breaking anything.

Social Media Chat Platform | *ASP.NET Core, SignalR, SQL Server, Entity Framework Core, JWT Auth*

- Built a full-stack platform with real-time messaging via SignalR, JWT authentication, and a SQL Server backend accessed through Entity Framework Core.
- Mainly built this to get familiar with WebSocket-based communication and scalable data access patterns outside of a work context – SignalR in particular was something I wanted proper hands-on time with.

TECHNICAL SKILLS

Languages: C#, SQL, T-SQL, JavaScript

Backend: ASP.NET Core, .NET 6/8, Web API, Entity Framework Core, Dependency Injection, REST APIs, SignalR, WebSockets

Auth & Security: JWT Tokens, SSO, OAuth2, OpenID Connect, Role-Based Access Control, IdentityServer4

Databases: Microsoft SQL Server, MongoDB, MySQL

Frontend: Blazor Server, Blazor WebAssembly, React.js, Angular (familiar), Bootstrap, SCSS

DevOps & Tooling: Docker (multi-stage builds), Azure, GitLab CI/CD pipelines, Git Flow, Jira, Windows Server, Postman

Ways of Working: Agile Scrum, code reviews, pair programming, TDD, SOLID principles
